

Geography of Tampa's Water Treatment

What's your water footprint?

The water footprint of a person or community is the total volume of freshwater used by the person or community. According to the Environmental Protection Agency, the average person uses about 100 gallons of water a day. In fact, one flush of the toilet uses as much water as the average person in the developing world uses for an entire day's cooking, washing, cleaning and drinking!

Conserving water is the best way to make sure we always have water for our planet and protect our environment.

Can you think of ways to lower your water footprint?
